

EUROPEAN RACE COMMITTEE

The CEC - caring for athletes' security conditions during competitions, on the basis of some tests made on several European tracks, since L'Aquila World Championships - considers Vesmaco solution as the best one under a security/safety point of view. Vesmaco flooring reduces risks and improves athletes' performances.

According to the above mentioned remarks, we send the L'Aquila (Italy) roller track blueprint to all European Federations. This Italian track, realized by Vesmaco company, is made from **durflex® 101 sp roller professional**: the resinous system homologated by FIRS. L'Aquila track was built under Vesmaco supervision, in conformity with the characteristics agreed on with FIRS, has a bituminous conglomerate support, with a specific grain size and a particular compaction degree. These complementary and decisive features, together with the specific synthetic covering **durflex® 101 sp roller professional** offer: the ease of use; the absence of connection joints; the high degree of perceived and effective adherence and smoothness. Such characteristics, as proved since L'Aquila 2004, have allowed improved chronometric results and have permitted new world records, offering to athletes the possibility to achieve their maximum capacity and compete in complete safety. **durflex® 101 sp roller professional** system passed a practicality test on wet surface and under pouring rain.

2010 European Championships is going to take place in San Benedetto del Tronto (Italia) on a roller track in **durflex® 100 sp roller professional**, studied by Vesmaco. It has conceived for the re-qualification of skating floorings from slippery concrete with high risk of falling to synthetic/resinous surfaces with high degree of smoothness with all climate conditions.

We would like to point out that, even if sport activities have some risks, it is obligatory to equip facilities, in this case the flooring, with all safety precautions that could safeguard athlete's integrity, reducing the risk of falling to a minimum. Otherwise the owner entity or the facility keeper will be responsible.
